the differential equation can be written as  $\dot{r}(t) = F(r(t))$  To say it in the language of vector calculus, we aim to find the flow lines of the vector field  $F$  Even having left the linear context, we can still use linear algebra to analyze such systems 232 A nonlinear system in population dynamics is the Murray system  $\dot{x} = x(6 - 2x - xy)$   $\dot{y} = y(4 - y - xy)$ :
